Several weeks ago, my parents and I went to our hometown to see our relatives during the holiday. We knew that traveling was not recommended during the pandemic. However, we assumed that seeing our relative for one day would be safe.

About a week after my return home, I had symptoms that looked like a mild cold. I had a slight cough and congestion. I didn't want to take a COVID-19 test because my parents didn't feel the symptoms. I believed that I just had a common cold. During that time, I couldn't smell or taste anything. While brushing my teeth in the morning, I found my toothpaste tasted like water.

Observing the symptoms, my father brought me to the hospital for a COVID- 19 test. After my test, I told myself that I didn't need to worry but I couldn't focus on anything for several days. Then I knew the result when my father said "Your COVID-19 test is positive". I didn't want to believe it. I had done everything right. How could I possibly contaminated?

My condition got worse after that. I felt fortunate because the disease had taken thousands of lives. I spent two weeks isolating myself inside my house, spending my time by reading and watching plenty of movies. My parents received negative test results, but the three of us continued to quarantine in the house just to be safe.

ICE STORM

When warm and cold air meet, the resulting weather phenomena can be an ice storm. Ice storms can be particularly dangerous because the freezing rain makes an icy glaze on roads and other outdoor surfaces. Very heavy amounts of ice brutally damage trees and weigh down electrical connection. In fact, the weight of the ice can be increased by 30 times. The weight of the ice is made worse if the wind speed is high. The areas with the highest frequency of freezing rain occasions are the Midwest and Northeast.

The accumulations of ice are classified according to the impacts they have. They are classified as nuisance, disruptive, and crippling. During a nuisance ice storm event, less than ¼ of an inch of ice accumulates. Travel, especially on roads with bridges, can be difficult. Disruptive ice storms are typically an ice accumulation of ¼ of an inch to ½ of an inch. During these storms there can be outages and sagging of breaking tree limbs. The most dangerous ice storm is the crippling variety. This category of storm causes widespread ice accumulations of over ½ inch, and may reach accumulations of one inch. Due to severe damage to trees and electrical connection, electricity may be interrupted for many days. This is especially dangerous for those who do not have back-up power solutions and go for prolonged periods with no heat.

A black hole is a place in space where gravity pulls so much that even light cannot get out. The gravity is so strong that matter has been squeezed into a tiny space. This can happen when a star is dying. Because no light can get out, people cannot see black holes. They are invisible.

Black holes can be big or small. Scientists think the smallest black holes are as small as just one atom. These black holes are very tiny but have the mass of a large mountain. Mass is the amount of matter, or "stuff," in an object. Another kind of black hole is called "stellar." Its mass can be up to 20 times more than the mass of the sun. The largest black holes are called "supermassive." These black holes have masses that are more than 1 million suns together. Scientists have found proof that every large galaxy contains a supermassive black hole at its center.

A black hole cannot be seen since strong gravity pulls all of the light into the middle of the black hole. But scientists can see how the strong gravity affects the stars and gas around the black hole. Scientists can study stars to find out if they are flying around, or orbiting, a black hole.

When a black hole and a star are close together, high-energy light is made. This kind of light cannot be seen with human eyes. Scientists use satellites and telescopes in space to see the high-energy light.

27. What is the text about?
    A. The way scientists study black holes.
    B. Various forms and size of black holes.
    C. The influence of gravity on black holes.

D. The common information of black boles.

28. It is hard to see black holes because ….
    A. stars are flying around the black holes
    B. there are stars and gas around the black holes
    C. gravity makes all light pushed into the black hole
    D. black holes do not emit light due to the intense gravity

29. What does the last paragraph talk about?
    A. How high-energy light is formed.
    B. How human eyes see high-energy light.
    C. How a black hole moves approaching a star.
    D. How scientists use tools to see high-energy light.

30. "…because matter has been squeezed into a tiny space." (Paragraph 1)
    The underlined word is closest in meaning to ….
    A. pulled
    B. pushed
    C. grabbed
    D. absorbed

31. Scientists have proven that the content of large galaxy is mostly a … black hole in the middle of it.
    A. regular
    B. usual
    C. huge
    D. pony
